Efficacy of Antiseptica products against the novel Corona virus

The novel Corona virus is an enveloped virus that is also transmissible from person to person. However, there is currently a lack of information on how exactly it is transmitted and which testing methods are available to test resistance to disinfectants.

The necessary hygiene measures must already be implemented in case of suspected disease.

Based on existing literature as well as laboratory results with our products it is known that Antiseptica disinfectants have a virucidal spectrum and can inactivate some enveloped viruses within 15 seconds. Nevertheless, we recommend a contact time of 30 seconds and the following products for ready-to-use alcoholic hand disinfection in case of suspected Corona virus:

Product	Contact time
Manorapid® r.f.u.	30 Sec
Manorapid® Basic	30 Sec
Manorapid® ^{Plus}	30 Sec
Manorapid® Synergy	30 Sec

The following products can be used for daily surface disinfection (e.g. light switches, door handles, wet areas) or for disinfecting contact surfaces immediately after transporting a sick person and before using the means of transport again, etc:

Product	Contact time
Big Spray New (ready-to-use)	1 Min
Biguacid Plus	1 % / 5 Min
Descocid®-N (food sector)	1 % / 15 Min
Oxygenon S (granulate)	1,5 % / 30 Min
Descorapid Wipes	30 Sec
Ethisol® Plus Wipes	1 Min

Of course, other antiseptic products are also effective. Let us advise you. In addition, our medical-scientific department will be happy to answer any questions you may have, Dr. Jan Tentrop is at your disposal at any time under Tel. 030 / 28094078.

We also recommend the use of hygiene stations/columns with appropriate dispensers in areas with a high frequency of public traffic.
